Fraud Detection

Fraud detection policies are today mandatory due to increasing by pass termination practices. As it is commonly known, these terminations violate interconnection agreements and produce important revenue shortages for operators.

ADECEF designs tailored by pass detection campaigns, by means of E2E traffic generation through local carriers, regional voip operators, calling cards and almost any traffic termination player in the telecommunication market. Once a fraud case is confirmed, the SimBox detection is performed via SS7 signaling. These activities are defined and supported by interconnection experts, with more than seven years experience in the LA wholesale and roaming markets.
